

YOUR INTERNATIONAL FORENSICS HUB  
ATLANTA, GA • OCT. 7-10, 2013

**ISHI Workshop on New Loci and Kits**  
October 10, 2013 (Atlanta, GA)  
**New Autosomal and Y-STR Loci and Kits:**  
**Making Data Driven Decisions**

# NIST Studies with New Y-STR Loci and Kits

Michael D. Coble

NIST Applied Genetics Group

# Product Disclaimer

- I will mention commercial STR kit names and information, but I am in no way attempting to endorse any specific products.
- **NIST Disclaimer:** Certain commercial equipment, instruments and materials are identified in order to specify experimental procedures as completely as possible. In no case does such identification imply a recommendation or it imply that any of the materials, instruments or equipment identified are necessarily the best available for the purpose.
- Points of view are mine and do not necessarily represent the official position of the National Institute of Standards and Technology or the U.S. Department of Justice. Our group receives or has received funding from the FBI Laboratory and the National Institute of Justice.

# Presentation Outline

- Brief Y-chromosome review
- Y-STR kits and loci
- U.S. population haplotype data – *FSI Genetics* article and Yfiler Plus loci studies
- Rapidly mutating (RM) Y-STRs
  - Utility for common Y-STR haplotypes
  - Utility for close relatives

# What has happened in the past decade...

- **Selection of core Y-STR loci** (SWGDDAM Jan 2003)
- “Full” Y-chromosome sequence became available in June 2003; over 700 Y-STR loci identified (only ~20 in 2000)
- **Commercial Y-STR kits released**
  - ~~Y-PLEX 6,5,12 (2001-03)~~, PowerPlex Y (9/03), **Yfiler** (12/04), **PPY23** (6/12)  
**Yfiler Plus (coming soon)**
- Many population studies performed and online databases generated with thousands of Y-STR haplotypes
- Forensic casework demonstrations showing value of Y-STR testing along with court acceptance
- Some renewed interest in Y-STRs to aid familial searching

19	-	-	-
20	-	-	-

9 of the 10 new loci alone perform slightly better than Yfiler

\*Note: Analysis does not include information from DYS460 in this study

# Disadvantages of the Y-Chromosome

- Loci are not independent of one another and therefore rare random match probabilities cannot be generated with the product rule; must use haplotypes (combination of alleles observed at all tested loci)
- **Paternal lineages possess the same Y-STR haplotype** (barring mutation) and thus fathers, sons, brothers, uncles, and paternal cousins cannot be distinguished from one another
- Not as informative as autosomal STR results
  - **More like addition ( $10 + 10 + 10 = 30$ ) than multiplication ( $10 \times 10 \times 10 = 1,000$ )**

# Using Y-STRs with a higher mutation rate, father-son and brother pairs can sometimes be distinguished

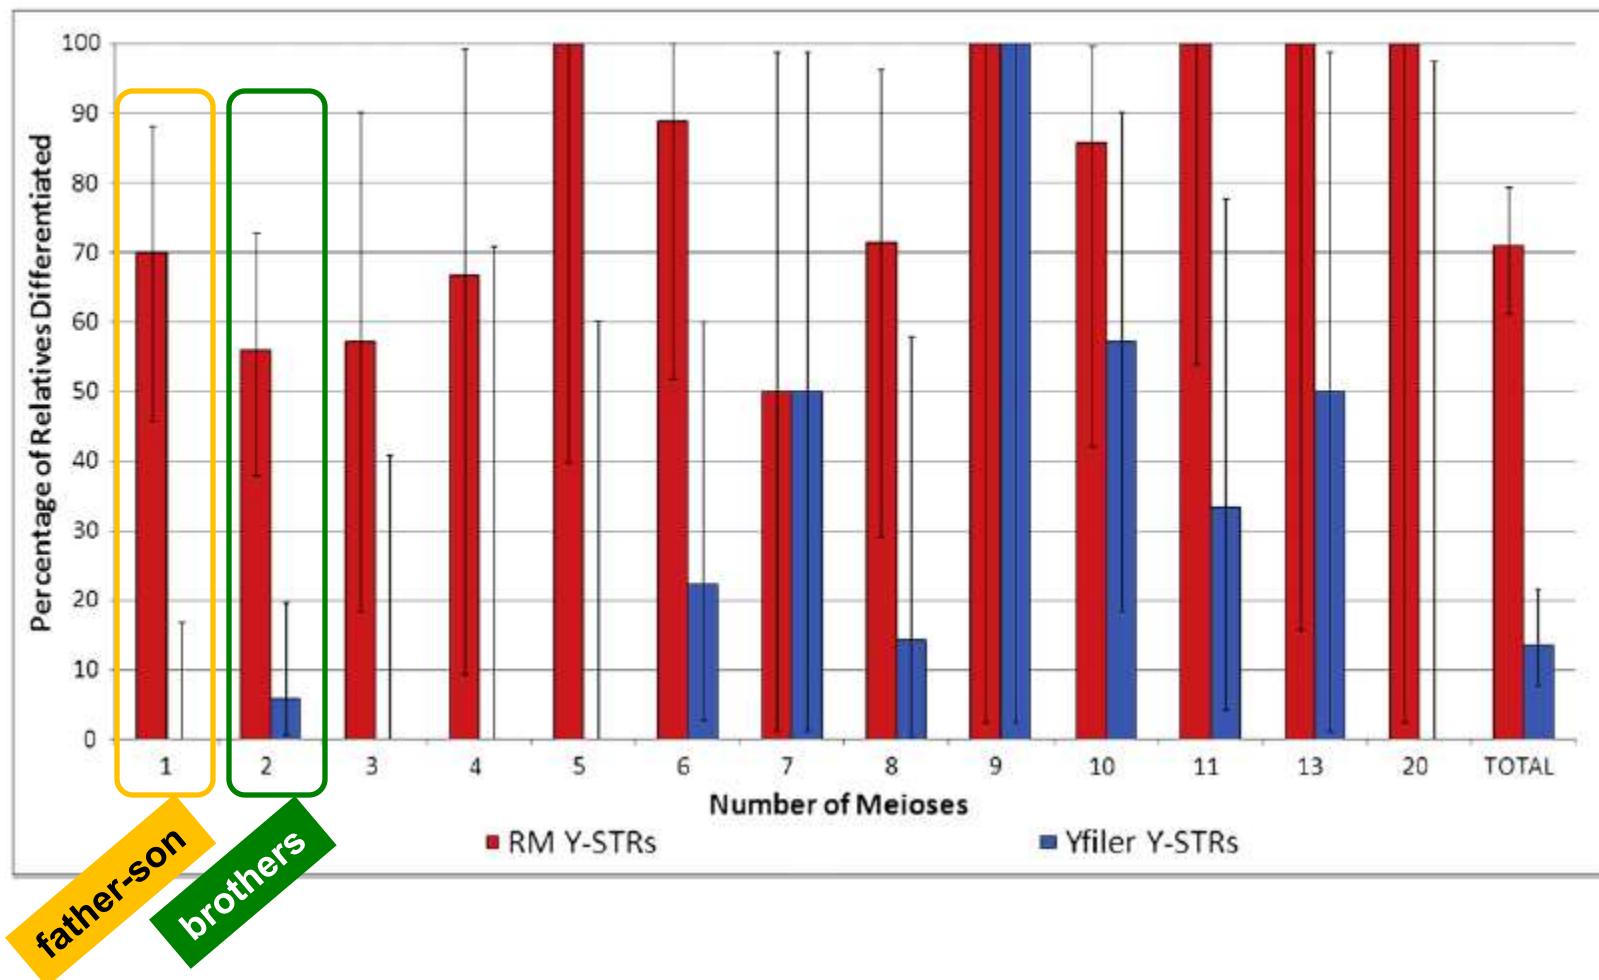

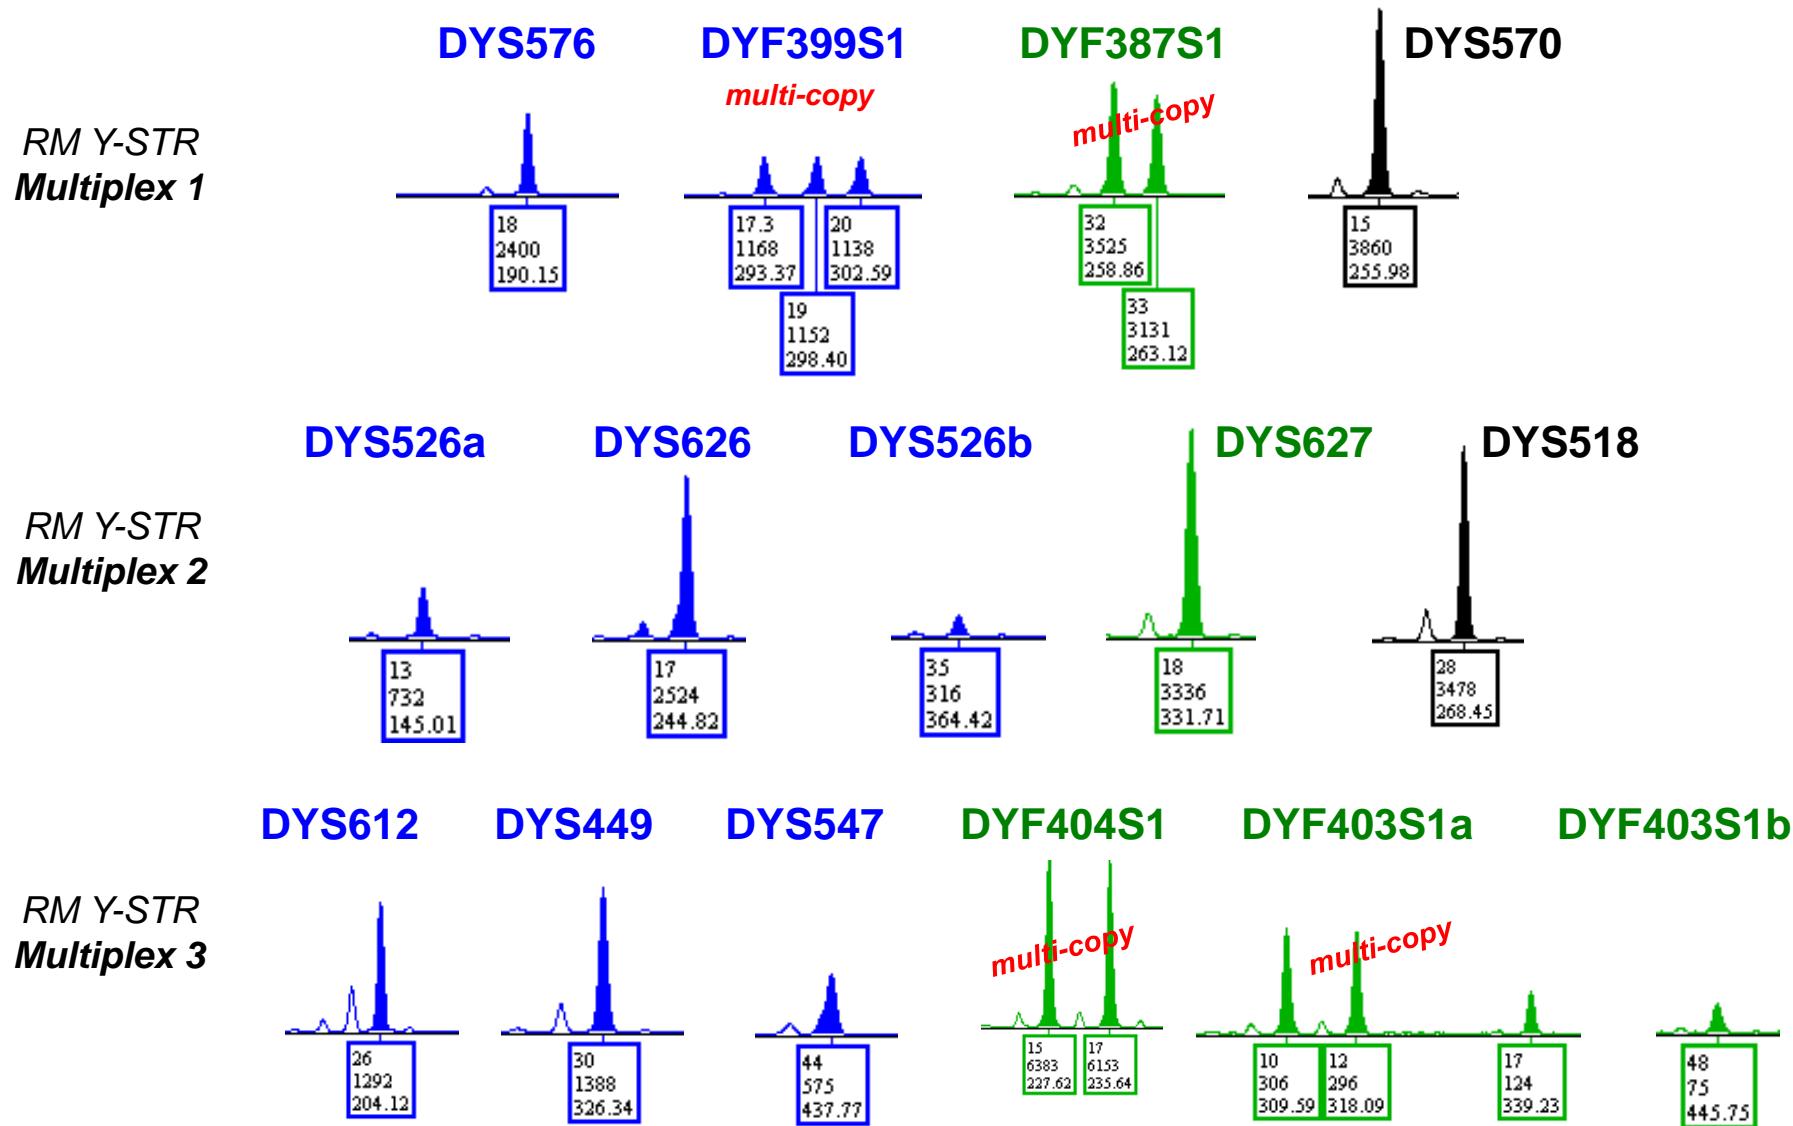

Figure 4. Male Relative Differentiation with Newly Identified 13 RM Y-STRs and Commonly Used 17 Yfiler Y-STRs

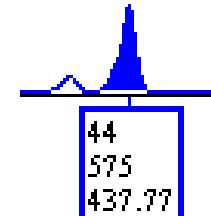

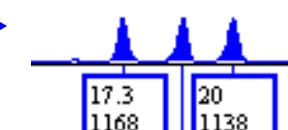

Results from differentiating between male relatives from analyzing 103 pairs from 80 male pedigrees, sorted according to the number of generations separating pedigree members, based on 13 RM Y-STRs (in red) and 17 Yfiler Y-STRs (in blue). Error bars represent 95% binomial confidence intervals. Note that these samples are independent from the father-son pairs initially used to establish the Y-STR mutation rates.

# Rapidly Mutating (RM) Y-STRs

NIST supplied data from 1,296 U.S. samples (634 population + 331 father/son pairs)  
to RM Y-STR Study Group led by Manfred Kayser

# Why do these markers mutate “rapidly”?

Markers in Yfiler Plus	Locus	(average mutation rate)	“Large” number of repeats
	DYS449	(1.2%)	
	DYS518	(1.8%)	
	DYS547	(2.4%)	 A blue arrow points from the text "Large" to this peak.
	DYS570	(1.2%)	
	DYS576	(1.4%)	
	DYS612	(1.4%)	
	DYS626	(1.2%)	 DYS547
	DYS627	(1.2%)	
	DYF387S1	(1.6%)	
	DYF399S1	(7.7%)	 Multi-copy Markers
	DYF403S1 a/b	(3.1/1.2%)	
	DYF404S1	(1.3%)	
	DYS526 a/b	(1.3%)	
	DYS458	(0.64%)	 DYF399S1
<p>DYS458 (0.64%) is highest in Yfiler loci where average is ~0.2%</p>			

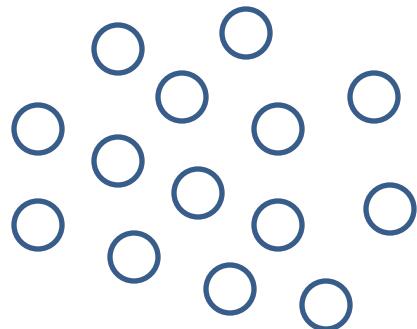

# Gene Diversity

- is a measure of the uniqueness of a particular marker in a given population

$$GD = (1 - \sum_i x_i^2)$$

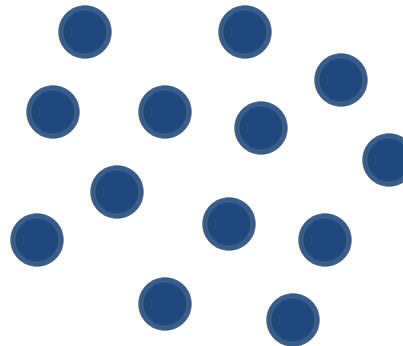

Relative frequency  
of each allele

$N = 100$

Marker Y  
→

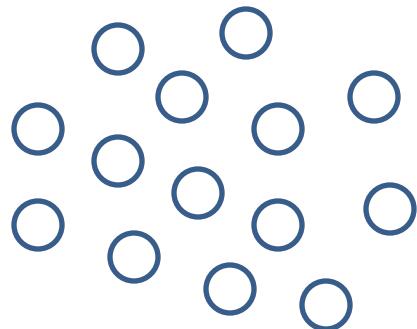

1 type = 100%

$$GD = \left(1 - \sum_i x_i^2\right)$$

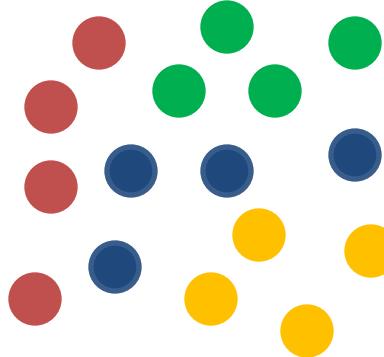

0

$$DC = 1/100 = 0.01$$

N = 100

Marker Y

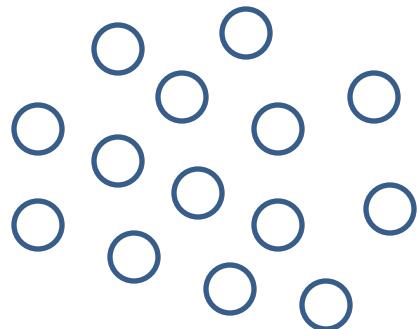

4 types = 25%

$$GD = \left(1 - \sum_i x_i^2\right)$$

A brace is positioned under the summation symbol ( $\sum_i$ ) in the formula for GD, spanning from the bottom of the 1 to the bottom of the  $x_i^2$ , indicating the scope of the summation over all 100 data points.

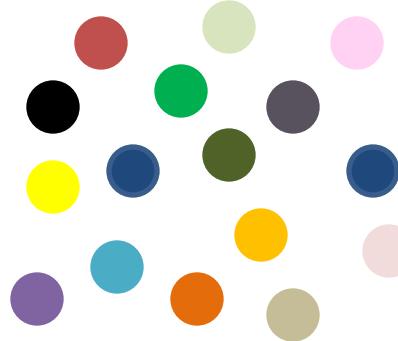

0.75

$$DC = 4/100 = 0.04$$

$N = 100$

Marker Y

100 types = 0%

$$GD = \left(1 - \sum_i x_i^2\right)$$

0.99

$$DC = 100/100 = 1.0$$

# Interpretational Issues

- We will need to move away from simply “excluding” based upon a set number of discordant markers.
- The Likelihood Ratio can provide weight to the evidence based upon competing propositions.
- This will require information on the ***haplotype frequency*** and ***mutation rate data***.

Relating two deep-rooted pedigrees from Central Germany  
by high-resolution Y-STR haplotyping

Manfred Kayser<sup>a,\*</sup>, Mark Vermeulen<sup>a,b</sup>, Hans Knoblauch<sup>c</sup>, Herbert Schuster<sup>d</sup>,  
Michael Krawczak<sup>e</sup>, Lutz Roewer<sup>f</sup>

Forensic Science International: Genetics 1 (2007) 125–128.

# Summary

- Rapidly Mutating Y-STRs are highly diverse markers that can discriminate common haplotypes and close relatives.
- These markers may create interpretational issues for paternity/missing persons cases, but LRs can be useful for evaluating these situations.
- An international consortium is gathering frequency and mutation rate data.
